Discovery and geology of the JB Zone at the REN property, Elko County, Nevada

Vance R. Spalding*, Gaylord Cleveland, and Kevin M. Conway
Centerra (U.S.) Inc., 559 W. Silver Street, Elko, NV 89801

ABSTRACT

The REN property is located on the northern Carlin trend, Nevada, Centerra (U.S.) Inc. and its predecessors, in joint venture with Homestake Mining Company (now wholly owned by Barrick Gold Corp.), began exploring the deep potential of REN in 1999 and in 2000 encountered a significant intercept in hole R0-246 grading 39.4 g/t Au over 36.6 m beginning at a depth of 828.4 m (1,480 m Asshan over 120 ft beginning at 2,718 ft). Discovery of the nearby JB zone followed in 2001 and 2002 when several adjacent drill holes returned high-grade gold intercepts, including 23.1 g/t Au over 19.6 m in hole R1-09C (0.628 ounces over 45 ft). The discovery holes targeted the area beneath a hill consisting of strongly altered upper plate rocks near an intersection of major structures, including the north-south-trending Rens (Post) fault. A large arsenic soil anomaly is located north of the JB zone. Anomalous rock chip gold values to 6.75 g/t were obtained from upper plate rocks in the area, although not directly above the JB zone.

A block model estimate compiled on four separate zones of mineralization at REN in December 2004, using an 8 g/t cutoff grade and an assay cap of 40 g/t, identified indicated resources of 1,873 M tonnes grading 13.1 g/t for 24.5 tonnes of contained gold (2,066 M tonnes grading 6.82 ounces for 70,000 oz), plus inferred resources of 1,261 M tonnes grading 12.7 g/t for 16.0 tonnes of contained gold (1,390 M tonnes grading 6.79 ounces for 516,000 oz). The JB zone is the largest of the four zones discovered to date, containing over half of the total resource. It extends from 700 to 900 m below the surface (3,300 to 3,150 ft) and is a typical Carlin-type deposit, hosted predominantly in dolomitic to calcareous siltstone and mudstone of the Devonian Popovich Formation in the lower plate of the Roberts Mountains thrust.

The Popovich Formation has been structurally disrupted and ranges from 0 to over 120 m to over 400 ft in thickness. It overlies the massive Shinarump-Devonian Bootlegger Basalt. The contact between the Popovich and Bootlegger is prone to karsting and collapse brecciation. A low-angle fault separates the Popovich from the overlying, strongly sheared, Devonian Rens Creek unit which is approximately 200 m (650 ft) in thickness. The Roberts Mountains thrust zone separates the Rens Creek from about 500 m (1,700 ft) of overlying Ordovician through Devonian strata of the upper plate.

Structural controls on gold mineralization in the JB zone are complex. A first-order control is low- to moderate-angle, north-dipping faults related to a duplex of favorable Popovich host rock, and the associated low-angle fault along the Popovich-Rens Creek contact. The mineralized zone strikes east-west, parallel to and in the

About This Collection

Welcome to the JB Zone, where high-grade heat and precious metal bodies take center stage. Watch as model REN and the Big Bosnian break it down in classic v-neck style, while Dakota Gold shines under street-art skies. From the future-in-the-air vibe to the mobile action, every snippet teases a full story. Don't be a fool—tap the link above to enter the zone and see it all.
